

# DON'T SAY YOU DIDN'T KNOW IT BEFORE! USE nJAMS FOR FULL-STACK MONITORING

Business performance is the only thing that really matters when it comes to IT monitoring. Our process visibility suite nJAMS helps you develop a business-oriented, top-down-approach and identifies ways to improve your overall monitoring and delivery costs. Argos is an extension of nJAMS Server. It allows you to unlock deeper insights by correlating infrastructure and business process performance.

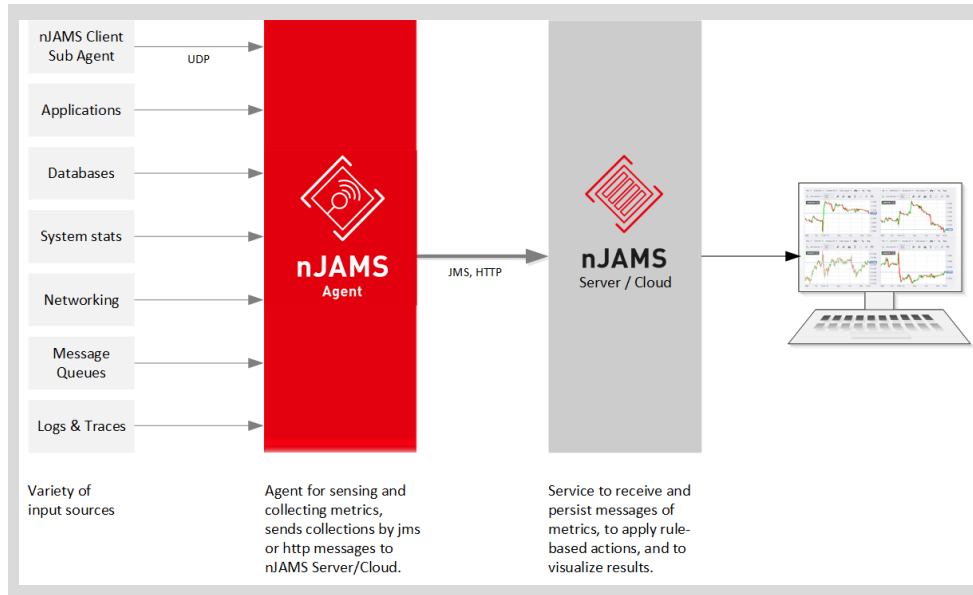

nJAMS is a powerful tool for IT and business users. It tracks technical and functional performance metrics as well as business KPIs in real time, from design to deployment. nJAMS simplifies the issue-resolution process through automated alerts and complete context information.

nJAMS Server 4.4 includes extended functionality to monitor and collect performance metrics from your infrastructure, which may have an impact on your overall process performance.

Today, enterprises demand that their critical business processes are always available and performing to their highest level. They require a visual overview that displays business performance in real time, highlights any technical issues as early as possible and shows the impact these issues might have on business performance.

A dedicated telemetry client collects metrics. For example from physical servers, network infrastructures, or storage infrastructures; or as related to overall bandwidth capacity or cloud-specific telemetry.

You can even define business rules to trigger sequence execution based on telemetry data.

#### nJAMS Features:

- **Integrated view of business process performance in real-time**  
Facilitates a single source of data and better cooperation between IT and business users
- **Full-stack monitoring**  
Helps businesses with relevant data for faster decision-making
  - **Infrastructure monitoring** (machine, CPU usage, memory usage, log files, network, etc.)
  - **Application monitoring** (throughput, availability, response time, log files, etc.)
  - **Business process monitoring** (performance, availability, throughput, response time, etc.)
- **Proactive alerts**  
Locates any situation that could turn into a business issue
- **Customizable drill-down charts & search based on business data**  
Allows more visibility, understanding and control of your business processes, applications and the underlying infrastructure – to solve any issues faster
